

Heavy duty access covers require the installation of an independently supported cover slab (see note 4)

NOTES:

1. Access covers are the responsibility of the client unless stated at time of tender.
2. The tank diameter is the nominal internal diameter, the civil engineer should allow 50mm all round to allow for joints, wall thicknesses and stiffening ribs
3. All civil engineering to be executed by others including fixing of any non-standard or heavy duty access cover.
4. The grp tank is not a load bearing member. Any non-standard or heavy duty manhole cover must be supported on a separate isolated roof slab.
5. Cable duct and sewer inlets may be positioned around the tank to suit clients reasonable requirements. Where the required position coincides with structural detail it will be placed in the nearest lower and/or highest adjacent position.
6. Reinforcing bars in concrete to be kept at least 75mm away from access opening in the vicinity of the top guide-rail bracket fixing holes.

Please indicate nominal internal sump dia.
